ComicCraft – AI Comic Story Creator

Project Workflow

ComicCraft follows a simple AI-powered workflow that converts a user's story idea into a structured comic story. The workflow consists of the following stages:

1. User Input

The user enters the comic title, story idea, main character, genre, and required number of comic panels through the web interface.

2. Input Validation

The application checks the entered information and ensures that the required fields contain valid data before sending the request to the backend.

3. Backend Processing

The frontend sends the comic request to the backend server using an API. The backend prepares the user's information as a structured prompt.

4. Gemini AI Processing

The backend sends the prompt to the Google Gemini model. Gemini generates the comic story, scenes, character actions, dialogue, and panel descriptions based on the user's input.

5. Story Generation

The generated AI response is processed and organized into individual comic panels. Each panel contains a scene description and dialogue or narration.

6. Comic Panel Display

The generated panels are returned to the frontend and displayed in a comic-style layout with panel numbers, scenes, characters, and speech bubbles.

7. User Review

The user can review the generated comic story and make changes to the input if a different story, genre, character, or panel structure is required.

8. Final Output

The completed comic story is presented to the user as the final AI-generated comic content. The application can be extended to support saving, downloading, or sharing the generated comic.

Workflow Summary

Step	Process

1	User Input
2	Input Validation
3	Backend Processing
4	Gemini AI Processing
5	Story & Panel Generation
6	Comic Panel Display
7	User Review
8	Final Comic Output
